Create a file upload form. Style it with CSS.

The form should allow the user to upload .png, .jpg,.gif, .doc, .xls, and .pdffiles. Into a folder named "uploads"(You need to create this folder and include it with your files, remove any uploads before zipping so you do not go overAngel's file limit size)

Convert the file to all lowercase and strip out any bad characters, spaces,etc..
Check to make sure the filename is not already in your uploads folder, if it is make sure your plan is not to overwrite the original.

Make sure you set the permissions on thisfolder (connect via FTP and set the permissions to 777, already done for you inuniform server).

After uploading provide a link to another php file that list the filenames already in your uploads folder to the user and provides a hyperlink to download them

There are some handy functions located underthe materials folder - make sure to read the powerpoint as well.

Here is an example link: http://morosko.org/advphp/week11-12/upload.html

Here is my file structure:

- upload.html (starting page with form)
- upload.php (processes upload)
- util.php (holds my function)
- filenames.php (shows files in uploads directory)

Upload your working URL below if you have one and all code zipped into a file.
